

SEVILLE™

INSECTICIDE

CONTAINS PYMETROZINE, THE ACTIVE INGREDIENT USED IN FULFILL®

FAST-ACTING APHID CONTROL

For an optimal solution against aphids in potato, celery, pecan, watermelon and other crops, turn to Seville™. Seville moves through translaminar and locally systemic activity, quickly dispersing through treated plant tissues. Upon ingestion, Seville stops aphids from feeding within a few hours, and results in death within 4-10 days. This insecticide has minimal impact on beneficial insects and up to two weeks of residual activity. Finally, by controlling aphids, Seville reduces the transmission of harmful plant diseases. Get ahead at the first signs of aphids with Seville.

KEY BENEFITS

- Upon ingestion, works quickly by inhibiting insect feeding
- Unique mode of action helps prevent insect resistance
- Stops aphids from feeding in all life stages
- Compatible with beneficial insects

KEY USES

- Celery
- Cotton
- Hops
- Pecans
- Potatoes
- Tobacco
- Tree Nuts
- Vegetables
- Watermelon

PRODUCT NOTES

EPA REGISTRATION NUMBER

91234-96

ACTIVE INGREDIENT

Pymetrozine 50%

FORMULATION

Water Dispersible Granule

IRAC NUMBER

9B

SIGNAL WORD

Caution

PACKAGE SIZE

6 X 27.5 wt oz

RESTRICTED USE

No

APPLICATION INFORMATION

Ground Spray Equipment

Use sufficient water to provide thorough, uniform coverage. Use sprayer nozzles that provide accurate, uniform application and medium-sized droplets. Calibrate sprayer from manufacturer's instructions or state's specifications to ensure delivery of adequate spray volume per unit area. Applications using sufficient water volume to provide thorough and uniform coverage will provide the most effective aphid pest control. For ground applications, use the minimum spray volume indicated in the 'crop use directions' section of the label. In situations where a dense canopy exists and/or aphid infestations are high, use greater water volumes.

Aerial Application

Apply Seville in water, using the minimum spray volume indicated in the 'crop use directions' section of the label. Increase spray volume under adverse conditions (i.e., high temperature, low relative humidity, dense plant canopy). Do not apply under conditions where uniform coverage cannot be obtained or where excessive spray drift or inversion may occur. Do not apply directly to humans or animals.

Spray Drift Precautions

As with all crop protection products, it is important to avoid off-target movement. Do not allow spray to drift onto adjacent land or crops. Follow these instructions to avoid spray drift.

- Do not apply when wind velocity exceeds 15 mph. Do not make applications when wind gusts approach 15 mph.
- Do not spray when conditions are favorable for drift (high temperatures, low relative humidity, drought) Do not apply during temperature inversions. If an inversion condition is suspected, consult with local weather services before making an application.
- Use the largest droplet size consistent with good pest control. Small droplets are more prone to spray drift, and can be minimized by appropriate nozzle selection, by orienting nozzles away from the air stream as much as possible, and by avoiding excessive spray boom pressure.
- Apply as close to target plants as practical to obtain a good spray pattern for adequate coverage. Do not make applications more than 10 ft. above the crop canopy.
- For aerial applications, mount the spray boom on the aircraft so as to minimize drift caused by wing tip vortices. The minimum practical boom length must be used and must not exceed 75% of wing span or rotor diameter.

KEY INSECTS

Asparagus aphid
Bean aphid
Bird cherry-oat aphid
Black pecan aphid
Blackmargined aphid
Buckthorn aphid
Cabbage aphid
Corn leaf aphid
English grain aphid
Green peach aphid
Hop aphid
Lettuce aphid
Melon/cotton aphid
Pea aphid
Potato aphid
Potato psyllid
Red lettuce aphid
Tobacco aphid
Turnip aphid
Yellow pecan aphid
