

TRAVELLA™ 20 SG: FOR LASTING CONTROL OF GREENHOUSE PESTS

Presented by Jane Stanley, Manager, Technical Services – Greenhouse & Nursery

HOW DOES TRAVELLA™ 20 SG WORK?

Travella™ 20 SG is an insecticide containing the active ingredient dinotefuran which controls insect pests such as aphids, mealybugs, fungus gnats, and whiteflies by overexciting their nervous systems. Formulated as a soluble granule, Travella works through contact, translaminar, and systemic activity to provide long-lasting residual control. Travella is labeled for use on ornamental plants grown in nurseries, greenhouses, interior and outdoor landscapes, tree plantations and forests. It can also be used on certain greenhouse-grown vegetable transplants.

BEST USES

The active ingredient in Travella 20 SG, dinotefuran, is in the neonicotinoid class of insecticides. It is unique because of its high solubility and strong systemic activity, meaning it quickly enters the plant's vascular system and readily moves throughout the plant's tissues. Because it is so soluble, dinotefuran moves rapidly, providing control of economically important pests in as little as one day in herbaceous plants. Additionally, dinotefuran controls both B- and Q-biotype whiteflies. Drench applications can give significant residual protection for up to three months, covering longer crop cycles. Travella 20 SG provides the efficacy and longevity needed to maintain profitability.

POLLINATOR SAFETY

When applying Travella 20 SG, it is important to follow all label instructions to minimize the risk of exposure to bees and other pollinators. As best practices, do not make applications while bees are actively foraging and do not apply to plants that are flowering.

EXAMPLE ROTATIONS

APHIDS		
PRODUCT	ACTIVE INGREDIENT	IRAC GROUP #
ASTERIA™	spirotetramat	23
TRAVELLA™ 20 SG	dinotefuran	4A
DEVENIR™	pymetrozine	9B

WHITEFLIES		
PRODUCT	ACTIVE INGREDIENT	IRAC GROUP #
AIRAXO™	flonicamid	29
TRAVELLA™ 20 SG	dinotefuran	4A
RVCAR®	pyrifluquinazon	9B
